

- Now, we introduce an additional algorithm for the Hitchcock Transportation problem, which was already introduced before
- This is the Alpha-Beta Algorithm

2

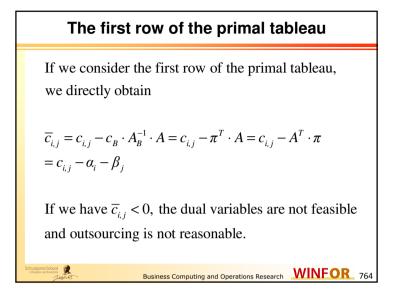

- It completes the list of solution approaches for solving this well-known problem
- The Alpha-Beta Algorithm is a primal-dual solution algorithm
- Owing to the simplicity of the dual problem, this procedure is capable of using significant insights into the problem structure

Business Computing and Operations Research WINFOR 760

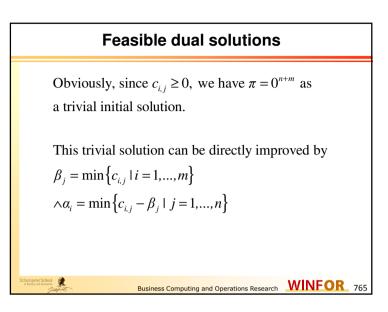

and the corresponding dual

Consider an example		
$a^{T} = \begin{pmatrix} 3 & 5 & 6 \end{pmatrix} \land b^{T} = \begin{pmatrix} 2 & 3 & 6 & 3 \end{pmatrix} \land c = \begin{pmatrix} 3 & 3 & 1 & 2 \\ 1 & 2 & 2 & 3 \\ 4 & 5 & 6 & 3 \end{pmatrix}$ $\Rightarrow$ Generating an initial solution : $\beta = \begin{pmatrix} 1 & 2 & 1 & 2 \end{pmatrix}^{T} \Rightarrow$ $\alpha = \begin{pmatrix} \min\{3-1,3-2,1-1,2-2\} \\ \min\{1-1,2-2,2-1,3-2\} \\ \min\{4-1,5-2,6-1,3-2\} \end{pmatrix} = \begin{pmatrix} \min\{2,1,0,0\} \\ \min\{0,0,1,1\} \\ \min\{3,3,5,1\} \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$		
Stanger stand The stand of the		

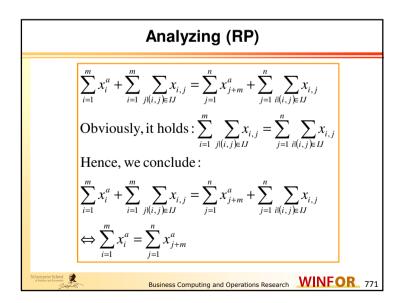

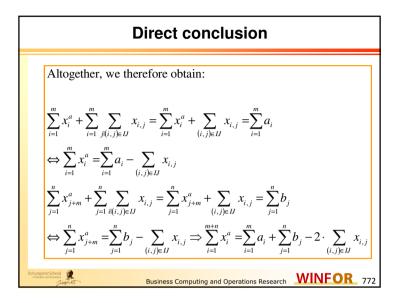

Example		
With $\alpha = (0 \ 0 \ 1)^T \land \beta = (1 \ 2 \ 1 \ 2)^T$ , we get $\overline{c} - (\alpha \ \alpha \ \alpha \ \alpha) - \begin{pmatrix} \beta^T \\ \beta^T \\ \beta^T \end{pmatrix}$ $= \begin{pmatrix} 3 \ 3 \ 1 \ 2 \\ 1 \ 2 \ 2 \ 3 \\ 4 \ 5 \ 6 \ 3 \end{pmatrix} - \begin{pmatrix} 0 \ 0 \ 0 \ 0 \\ 0 \ 0 \ 0 \ 0 \\ 1 \ 1 \ 1 \ 1 \end{pmatrix} - \begin{pmatrix} 1 \ 2 \ 1 \ 2 \\ 1 \ 2 \ 1 \ 2 \\ 1 \ 2 \ 1 \ 2 \end{pmatrix}$ $= \begin{pmatrix} 2 \ 1 \ 0 \ 0 \\ 0 \ 0 \ 1 \ 1 \\ 2 \ 2 \ 4 \ 0 \end{pmatrix} \ge 0.$ Thus, the solution is obviously feasible		
Business Computing and Operations Research WINFOR 767		

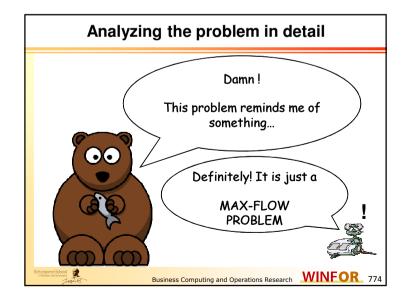

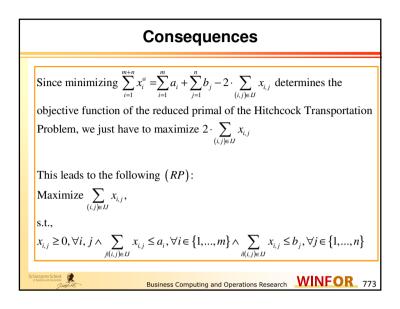

8.2 Analyzing the reduced primal (RP)	
Obviously, it holds: $\sum_{i=1}^{m} a_i = \sum_{i=1}^{m} \left( x_i^a + \sum_{j \mid (i,j) \in IJ} x_{i,j} \right) \wedge \sum_{j=1}^{n} b_j = \sum_{j=1}^{n} \left( x_{j+m}^a + \sum_{i \mid (i,j) \in IJ} x_{i,j} \right)$ Since total demand and supply are identical, we have $\sum_{i=1}^{m} a_i = \sum_{j=1}^{n} b_j \Leftrightarrow \sum_{i=1}^{m} \left( x_i^a + \sum_{j \mid (i,j) \in IJ} x_{i,j} \right) = \sum_{j=1}^{n} \left( x_{j+m}^a + \sum_{i \mid (i,j) \in IJ} x_{i,j} \right)$ $\Leftrightarrow \sum_{i=1}^{m} x_i^a + \sum_{i=1}^{m} \sum_{j \mid (i,j) \in IJ} x_{i,j} = \sum_{j=1}^{n} x_{j+m}^a + \sum_{j=1}^{n} \sum_{i \mid (i,j) \in IJ} x_{i,j}$	
Business Computing and Operations Research WINEOR 770	

	The RP is a specific Flow Problem		
	Obviously, the problem ( <i>RP</i> ) can be modeled as		
	a Max-Flow Problem.		
	For this purpose, we define the following network:		
	$V = \{s, v_1,, v_m, w_1,, w_n, t\}$		
	$E = \left\{ \left(s, v_i\right)   1 \le i \le m \right\} \cup \left\{ \left(v_i, w_j\right)   1 \le i \le m \land 1 \le j \le n \land (i, j) \in IJ \right\}$		
	$\cup \left\{ \left(w_{j}, t\right)   1 \le j \le n \right\}$		
	$c(s, v_i) = a_i, \forall i \in \{1,, m\} \land c(v_i, w_j) = \infty, \forall (i, j) \in IJ$		
	$\wedge c(w_j, t) = b_j, \forall j \in \{1,, n\}$		
S	Business Computing and Operations Research WINFOR 775		

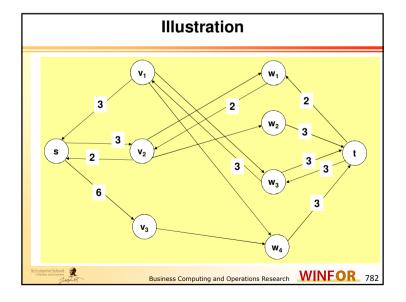

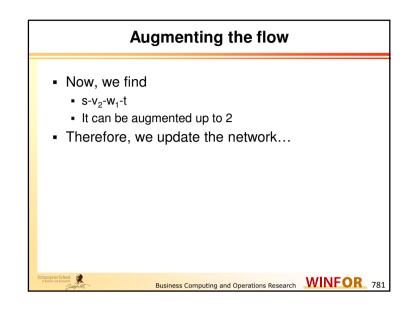

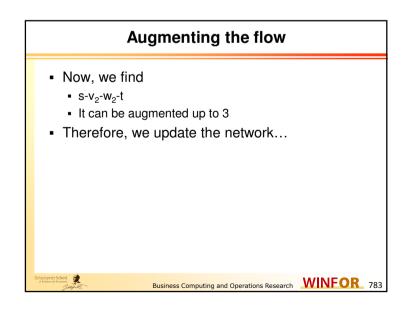

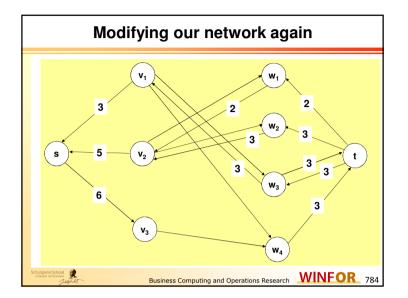

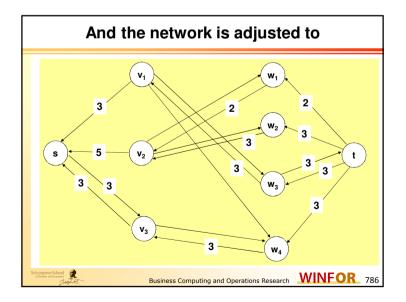

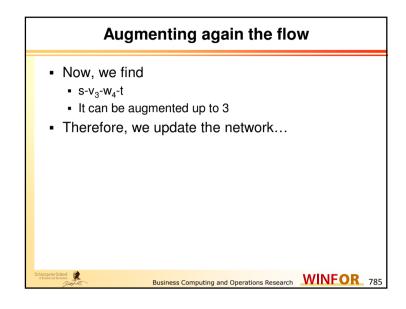

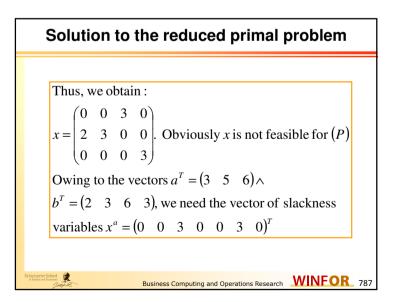

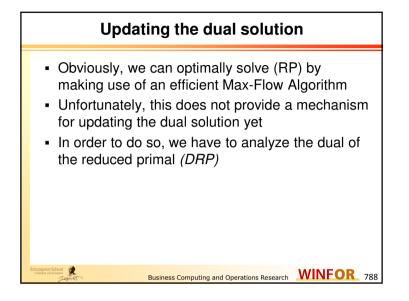

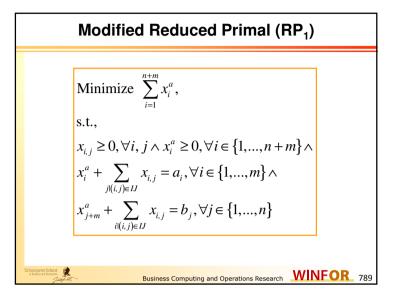

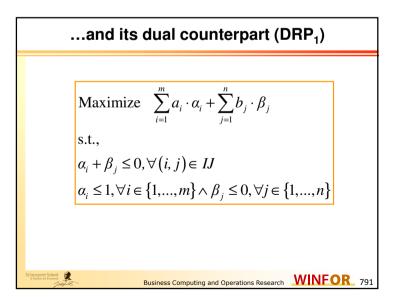

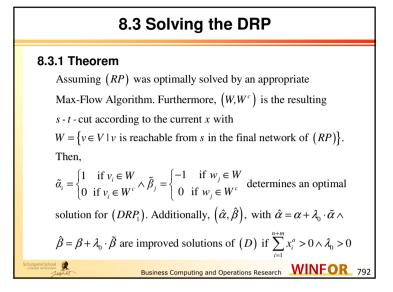

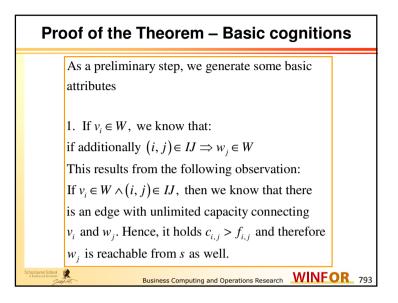

Modified Reduced Primal (RP <sub>1</sub> )		
Since it holds		
$\sum_{i=1}^{m} \left( x_i^a + \sum_{j(i,j) \in U} x_{i,j} \right) = \sum_{i=1}^{m} a_i = \sum_{j=1}^{n} b_j = \sum_{j=1}^{n} \left( x_{j+m}^a + \sum_{i(i,j) \in U} x_{i,j} \right)$		
$\Leftrightarrow \sum_{i=1}^m x_i^a + \sum_{i=1}^m \sum_{j \mid (i,j) \in U} x_{i,j} = \sum_{j=1}^n x_{j+m}^a + \sum_{j=1}^n \sum_{i \mid (i,j) \in U} x_{i,j}$		
$\Leftrightarrow \sum_{i=1}^m x_i^a + \sum_{(i,j)\in U} x_{i,j} = \sum_{j=1}^n x_{j+m}^a \sum_{(i,j)\in U} x_{i,j} \Leftrightarrow \sum_{i=1}^m x_i^a = \sum_{j=1}^n x_{j+m}^a \Leftrightarrow 2 \cdot \sum_{i=1}^m x_i^a = \sum_{i=1}^{m+n} x_i^a$		
Thus, we obtain the equivalent problem:		
$\text{Minimize } \sum_{i=1}^{m} x_i^a, \text{ s.t., } x_{i,j} \ge 0, \forall i, j \land x_i^a \ge 0, \forall i \in \{1,, n+m\} \land$		
$x_i^a + \sum_{j(i,j) \in U} x_{i,j} = a_i, \forall i \in \{1,,m\} \land x_{j+m}^a + \sum_{i(i,j) \in U} x_{i,j} = b_j, \forall j \in \{1,,n\}$		
Business Computing and Operations Research WINFOR 790		

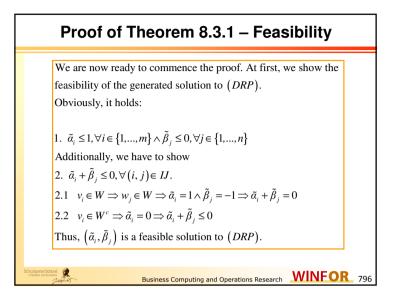

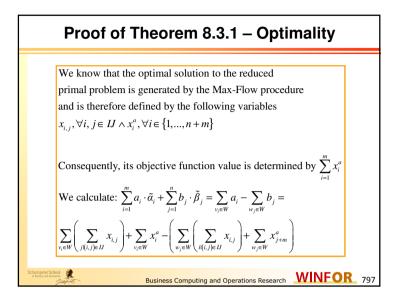

Proof of the Theorem – Basic cognitions		
2. Corollary:		
$v_i \in W \land w_j \in W^c \Longrightarrow (i, j) \notin IJ$		
3. If $w_i \in W \land (i, j) \in IJ \land x_{i, j} > 0 \Longrightarrow v_i \in W$		
This results from the following observation:		
Since $x_{i,j} > 0$ , a former step has established		
a connection between $v_i$ and $w_j$ . Thus we have a backward link from $w_i$ to $v_i$ with		
capacity $x_{i,j} > 0$ .		
Business Computing and Operations Research WINEOR 794		

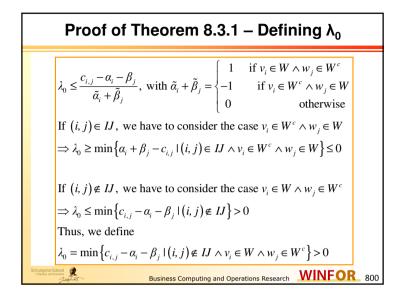

Proof of the Theorem – Basic cognitions		
4. Corollary: $v_i \in W^c \land w_j \in W \Longrightarrow (i, j) \notin IJ \lor x_{i,j} = 0$		
In what follows, $r_{i,j}$ denotes the remaining capacity		
on the link $(i, j)$ , with		
$(i, j) \in \{(v_i, w_j)   (i, j) \in IJ\} \cup \{(s, v_i)   i \in \{1,, m\}\} \cup \{(w_j, t)   j \in \{1,, n\}\}.$		
5. $v_i \in W^c \Rightarrow r_{s,v_i} = 0 \Rightarrow \sum_{j (i,j) \in E} x_{i,j} = a_i \Rightarrow x_i^a = 0$		
6. $w_j \in W \Rightarrow r_{w_j,i} = 0 \Rightarrow \sum_{i(i,j) \in E} x_{i,j} = b_j \Rightarrow x_{j+m}^a = 0$		
Business Computing and Operations Research WINFOR 795		

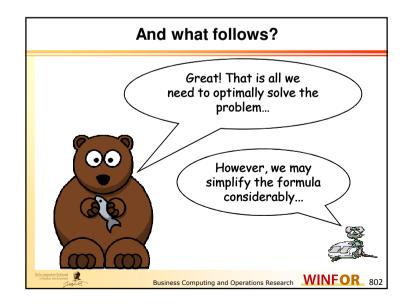

RP and DRP have identical objective values		
And thus, it holds: $\sum_{i=1}^{m} a_i \cdot \alpha_i + \sum_{j=1}^{n} b_j \cdot \beta_j = \sum_{v_i \in W} \left( \sum_{j(i,j) \in IJ} x_{i,j} \right) + \sum_{v_i \in W} x_i^a - \sum_{w_j \in W} \left( \sum_{i(i,j) \in IJ} x_{i,j} \right) - \sum_{w_j \in W} x_{j+m}^a = \sum_{i(j) \in IJ} x_{i,j} - \sum_{(i,j) \in IJ} x_{i,j} + \sum_{v_i \in W} x_i^a - \sum_{w_j \in W} x_{j+m}^a = \sum_{v_i \in W} x_i^a - \sum_{w_j \in W} x_i^a - \sum_{w_j \in W} x_i^a = \sum_{v_i \in W} x_i^a = \sum_{i=1}^{m} x_i^a$ Owing to attribute 6, this is equal to 0		
Thus, $\left( ilde{lpha}, ilde{eta} ight)$ is an optimal solution to $\left(DRP_1 ight)$		
Business Computing and Operations Research WINEOR 798		

Feasibility of the updated dual solution		
It has to be guarant $\alpha_i + \lambda_0 \cdot \tilde{\alpha}_i + \beta_j + \lambda_0 \cdot \tilde{\alpha}_i$	$ = (\alpha, \beta) + \lambda_0 \cdot (\tilde{\alpha}, \tilde{\beta}) $ eed $ \cdot \tilde{\beta}_j \le c_{i,j} \Leftrightarrow \alpha_i + \beta_j + \lambda_0 \cdot \tilde{\alpha}_i + \lambda_0 \cdot \tilde$	$_{0}\cdot\tilde{\beta}_{j}\leq c_{i,j}$
	$\begin{aligned} \alpha_i + \beta_j \\ v_i \in W \land w_j \in W \\ i \in W^c \land w_j \in W^c \\ f v_i \in W^c \land w_j \in W^c \\ v_i \in W \land w_j \in W^c \end{aligned} = \begin{cases} 1 & \text{if } v_i \\ -1 & \text{if } v_i \\ 0 \end{cases}$	$\in W \land w_j \in W^c$ $\in W^c \land w_j \in W$ otherwise
Schumpeter School	Business Computing and Operations Research	WINFOR 799

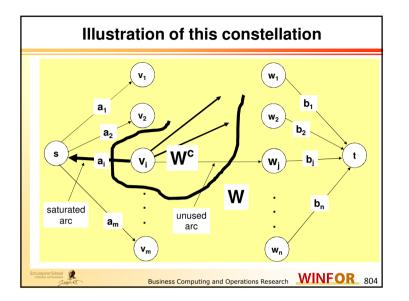

Quality of the new dual solution	
With $\lambda_0 = \min\{c_{i,j} - \alpha_i - \beta_j \mid (i,j) \notin IJ\} > 0$ , we calculate	
$\sum_{i=1}^{m} a_i \cdot (\alpha_i + \lambda_0 \cdot \widetilde{\alpha}_i) + \sum_{j=1}^{n} b_j \cdot (\beta_j + \lambda_0 \cdot \widetilde{\beta}_j) =$	
$\sum_{i=1}^{m} (a_i \cdot \alpha_i + \lambda_0 \cdot a_i \cdot \widetilde{\alpha}_i) + \sum_{j=1}^{n} (b_j \cdot \beta_j + \lambda_0 \cdot b_j \cdot \widetilde{\beta}_j) =$	
$\sum_{i=1}^{m} a_i \cdot \alpha_i + \sum_{j=1}^{n} b_j \cdot \beta_j + \lambda_0 \cdot \left( \sum_{i=1}^{m} a_i \cdot \widetilde{\alpha}_i + \sum_{j=1}^{n} b_j \cdot \widetilde{\beta}_j \right) =$	
$\sum_{i=1}^{m} a_i \cdot \alpha_i + \sum_{j=1}^{n} b_j \cdot \beta_j + \lambda_0 \cdot \left(\sum_{i=1}^{m} x_i^a\right) \underset{\text{If } \sum_{i=1}^{m} x_i^a > 0}{\geq} \sum_{i=1}^{m} a_i \cdot \alpha_i + \sum_{j=1}^{n} b_j \cdot \beta_j$	
Business Computing and Operations Research WINFOR 801	

## Important observation – Part 1

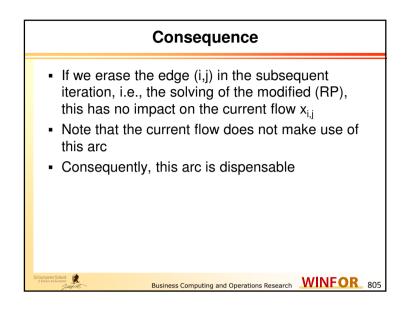

We consider the resulting constellation after applying the Max-Flow procedure. Addionally, we analyze the generated flow  $x_{i,j}$ . First of all, we consider arcs that vanish in the next iteration. This may happen only if  $(i, j) \in IJ$  in the current iteration, but in the next one it holds  $(i, j) \notin IJ$ . This case is characterized that originally  $\alpha_i + \beta_j = c_{i,j}$  applies, but subsequently  $\hat{\alpha}_i + \hat{\beta}_j < c_{i,j}$  holds. Note that this is only possible if  $\tilde{\alpha}_i + \tilde{\beta}_j < 0 \Rightarrow \tilde{\alpha}_i + \tilde{\beta}_j = -1$ . This is the constellation  $v_i \in W^c \land w_j \in W$ . It is illustrated on the next slide. Here, we directly conclude that the arc  $(i, j) \in IJ$  was not used by the generated flow at all. Hence, we obtain  $x_{i,j} = 0$ .

el 🕵

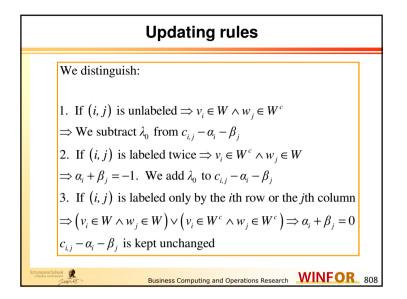

Business Computing and Operations Research WINFOR 803

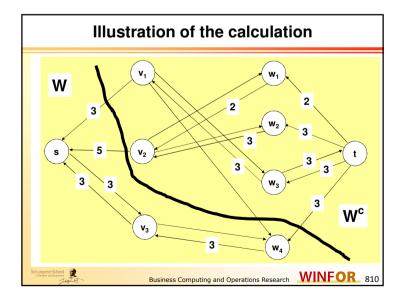

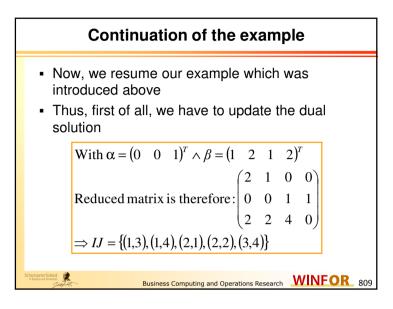

Observations II		
Now we consider arcs $(i, j) \in IJ$ with $x_{i,j} > 0$ . We		
know that it holds $\hat{\alpha}_i + \hat{\beta}_j = c_{i,j} \implies \tilde{\alpha}_i + \tilde{\beta}_j = 0.$		
Therefore, the flow $x_{i,j} > 0$ can be kept on these arcs.		
Anyhow, the resulting flow $x_{i,j}$ can be kept for the next		
iteration of solving $(RP)$ that arises after updating $\alpha$ and		
$\beta$ . Note that this update may cause additional arcs between		
the $v_i$ – and $w_j$ – nodes.		
Business Computing and Operations Research WINFOR 806		

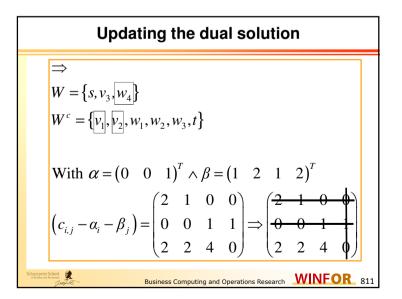

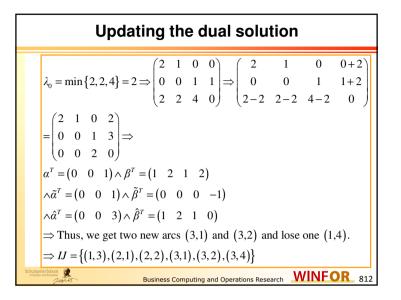

Calculating $\lambda_0$		
$\lambda_0 = \min \big\{ c_{i,j} - \alpha \big\}$	$a_i - \beta_j \mid (i, j) \notin IJ \land v_i \in W \land w_j \in W^c \}$	
Thus, we can lat	bel all rows <i>i</i> in the reduced matrix	
$(c_{i,j}-\alpha_i-\beta_j)$ w	ith $v_i \in W^c$ . Additionally, we label all	
columns $j$ with $v$	$v_j \in W.$	
Then $\lambda_0$ is determined as the termination of terminatio of	nined by the minimum unlabeled value.	
We update $(c_{i,j})$	$-\hat{\alpha}_i - \hat{\beta}_j$ by applying the following rules:	
Schumpeter School	Business Computing and Operations Research WINEOR 807	

	Results	
flow • Thus, <i>x</i> is kept • However, we have	ve are not able to aug as a maximum flow ave changed the sets red in the following	
Schumpeter School	usiness Computing and Operations Research	WINFOR 815

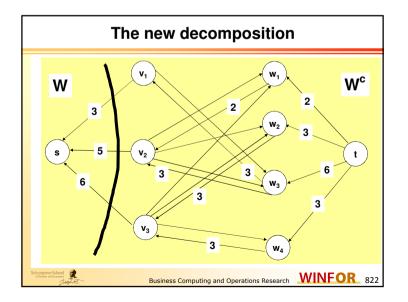

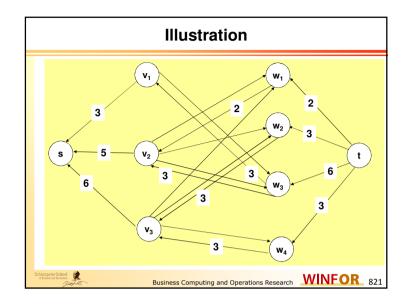

Updating the dual solution		
$\lambda_{0} = \min\{2,1\} = 1 \Rightarrow \begin{pmatrix} 2 & 1 & 0 & 2 \\ 0 & 0 & 1 & 3 \\ 0 & 0 & 2 & 0 \end{pmatrix} \Rightarrow \begin{pmatrix} 3 & 2 & 0 & 3 \\ 0 & 0 & 0 & 3 \\ 0 & 0 & 1 & 0 \end{pmatrix}$ $\alpha^{T} = (0  0  3) \land \beta^{T} = (1  2  1  0)$ $\land \tilde{\alpha}^{T} = (0  1  1) \land \tilde{\beta}^{T} = (-1  -1  0  -1)$ $\Rightarrow \tilde{\alpha}^{T} = (0  1  4) \land \tilde{\beta}^{T} = (0  1  1  -1)$ $\Rightarrow \text{Thus, we get a new arcs } (2,3).$ $\Rightarrow IJ = \{(1,3), (2,1), (2,2), (2,3)(3,1), (3,2), (3,4)\}$		
Stangard Stand Sta		

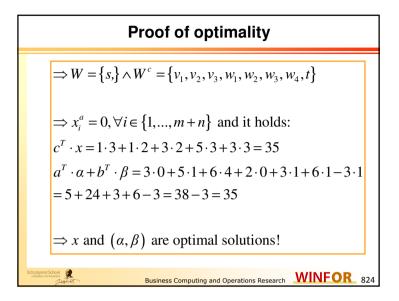

The modified primal solution			
$\Rightarrow W = \{s,\} \land W^{c} = \{v_{1}, v_{2}, v_{3}, w_{1}, w_{2}, w_{3}, w_{4}, t\}$ With $\alpha = (0 \ 1 \ 4)^{T} \land \beta = (0 \ 1 \ 1 \ -1)^{T}$ $x = \begin{pmatrix} 0 \ 0 \ 3 \ 0 \\ 2 \ 0 \ 3 \ 0 \\ 0 \ 3 \ 0 \ 3 \end{pmatrix}$ $\Rightarrow \text{ Is feasible for } a^{T} = (3 \ 5 \ 6) \land b^{T} = (2 \ 3 \ 6 \ 3)$			
Business Computing and Operations Research WINFOR 823
